

Intermittent fasting: Czech vs Polish Wikipedia

Q1666254 · 2024-09-21 to 2026-09-21 · editions: cs, pl · agent=user access=all-access

Question: Compare the growth of interest in intermittent fasting in the Polish and Czech Wikipedia over the last two years.

cs.wikipedia

reliability D

Not measurable: only 9.2 views/day on average (floor is 10): day-to-day counts at this level are dominated by noise, and a % change is not measurable. Treat this edition as unmeasured, not as flat - the point estimate below is reported for context only and must not be quoted as a growth rate.

· only 9.2 views/day on average (floor is 10): day-to-day counts at this level are dominated by noise, and a % change is not measurable

· low volume (9 views/day): percentage changes are unstable at this scale

pl.wikipedia

reliability D

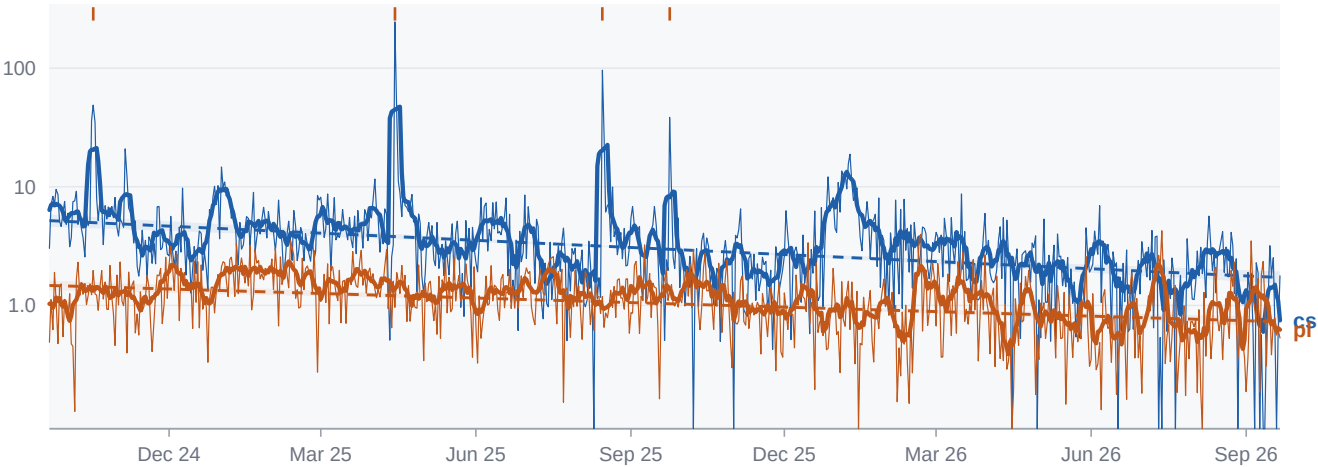

Not measurable: only 8.0 views/day on average (floor is 10): day-to-day counts at this level are dominated by noise, and a % change is not measurable. Treat this edition as unmeasured, not as flat - the point estimate below is reported for context only and must not be quoted as a growth rate.

· only 8.0 views/day on average (floor is 10): day-to-day counts at this level are dominated by noise, and a % change is not measurable

· low volume (8 views/day): percentage changes are unstable at this scale

Share of the edition's pageviews (per million)

thin line: daily values · thick line: 7-day mean · dashed: fitted trend with 95% band · orange ticks: detected event spikes

Growth in attention share, % per year (spike-free estimate where growth is event-driven)

cs	not measurable	only 9.2 views/day on average (floor is 10): day-to...
pl	not measurable	only 8.0 views/day on average (floor is 10): day-to...

edition	views/day	per million	%/yr	95% CI	YoY	adj p	wiki %/yr	spikes	grade
cs	2.9	1.76	-42%	-49..-35	-50%	<0.001	-12%	6	D
pl	5.4	0.95	-30%	-36..-23	-31%	<0.001	-9%	0	D

views/day and per-million are 90-day means. "wiki %/yr" is the whole edition's traffic trend, for context.

Assumptions and limitations

- Wikipedia pageviews measure curiosity, not purchase intent. A rising article is a reason to run a landing-page or ad test, not evidence of a market.
- Counts use agent=user and access=all-access. Wikimedia's bot filtering is best-effort and its accuracy has changed over time, which can create step changes unrelated to demand.
- Views are counted per article title. Page moves, merges and redirect changes can shift traffic between titles without any change in interest.
- Each language edition is read by a different and not strictly national audience: many speakers of smaller languages read the English, Russian or German editions instead, which understates their home edition.
- Share of a wiki's total pageviews is the default metric. It controls for wiki-wide traffic changes, but it falls when the wiki grows for unrelated reasons.
- 2 language editions were tested, so p-values are Benjamini-Hochberg adjusted for multiple comparisons.
- Only the canonical article title was counted. Traffic arriving through redirects is excluded; re-run with --include-redirects to include it.
